Sirius RTK GNSS Base (F9P)

& high-precision L1/L2 GNSS Base based on U-blox ZED-F9P (GPS / GLONASS / BeiDou / Galileo)

98.4x98.4x39.7 mm

Description

The Sirius RTK GNSS Base F9P is an affordable compact and high precision L1/L2 GNSS RTK device.

Based on the last generation of GNSS U-blox ZED-F9P modules, the Sirius F9P Base offers reliable and fast convergence time.

The device allows concurrent reception of GPS / GLONASS / BeiDou & Galileo to improve signal availability.

The built-in 3000mAh batteries give the Base a full working day autonomy.

The JST-GH connectors make them perfect to be connected to any Drotek telemetry kit or autopilot.

The Sirius Base F9P & Nylon PA12 case are guaranteed to operate over a temperature range of -20°C to +70°C.

Features

- Built-in 3000mAh batteries
- 5V - 150mA power supply
- L1/L2 30dbi active antenna
- 3000mAh built-in batteries
- Battery level LED indicators
- LEDs status : Timepulse/Power/RTK
- Timepulse & External Interrupt
- USB/I²C/SPI/UART digital interfaces

Applications

- RTK Base
- Precise navigation
- Automation of moving machinery

3.   Absolute maximum ratings

Stresses above those listed as "absolute maximum ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 9. Sirius F9P Base absolute maximum ratings

Symbol	Parameter	Maximum value	Unit
Vusb	USB supply voltage	-0.3 to +6	V
Vdd	Internal supply voltage	-0.5 to +3.6	V
Vdd_IO	I/O pins supply voltage	-0.5 to Vdd+0.5	V

TSTG	Storage temperature	-40 to +80	°C

⚠ CAUTION Electrostatic sensitive device

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

5.   Communication interfaces

There are several communications interfaces including UART, I2C and USB. All the inputs have internal pull-up resistors in normal operation and can be left open if not used. All the PIOs are supplied by VCC, therefore all the voltage levels of the PIO pins are related to Vdd supply voltage.

5.1   UART Interface

There are two UART interfaces: UART1 and UART2. UART1 and UART2 operate up to and including a speed of 921600 baud. No hardware flow control on UART1 and UART2 is supported.
Figure 7. UART chronogram specifications

Table 10. Sirius F9P Rover serial UART timing specifications

Symbol	Parameter	Min.	Max.	Unit
Vil	LOW-LEVEL input voltage	0	0.2xVdd	V
Vih	HIGH-LEVEL input voltage	0.7xVdd	Vdd+0.3	V
tECH	HIGH period of external data input	0	0.4	µs
tECL	LOW period of external data input	TBA	TBA	µs
Ru	Baudrate	9600	921600	bps
tCR	Rise time of data		5	ns
tCF	Fall time of data		5	ns

5.2 Slave I2C interface

An I2C compliant interface is available for communication with an external host CPU. The interface can be operated in slave mode only. It is fully compatible with Fast-Mode of the I2C industry standard. Since the maximum SCL clock frequency is 400 kHz, the maximum bit rate is 400 kbit/s. The interface stretches the clock when slowed down while serving interrupts, therefore the real bit rates may be slightly lower.

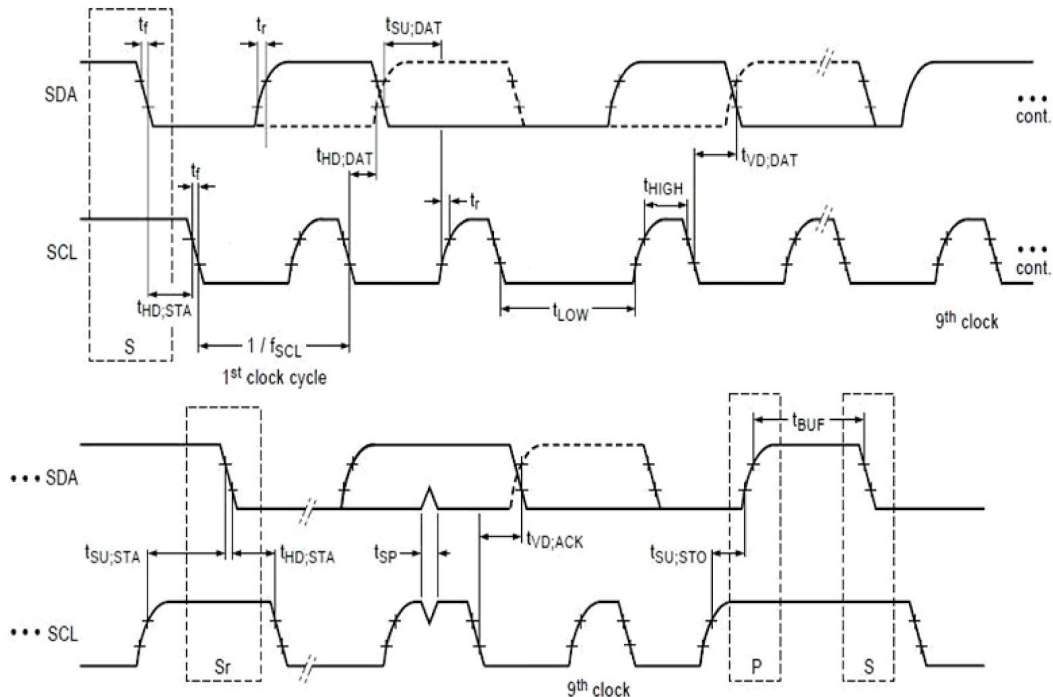

Table 11. Sirius F9P Rover I2C timing specifications

Symbol	Parameter	Min	Max	Unit
Vil	LOW-LEVEL input voltage	Vss-0.3	0.3xVdd	V
Vih	HIGH-LEVEL input voltage	0.7xVdd	Vdd+0.3	V
Vol	LOW-LEVEL output voltage		0.4	V
Voh	HIGH-LEVEL output voltage	Vdd-0.4		V
Fscl	SCL clock frequency	0	400	KHz

5.3 USB interface

A USB interface, which is compatible to USB version 2.0 FS (Full Speed, 12 Mbit/s), can be used for communication as an alternative to the UART.
